Why use dental whitening?

Over time your teeth can become stained from different foods, drinks and certain drugs. This discoloration can affect your appearance and self-confidence. Everbrite™ will effectively whiten your teeth so you can always show off your confident smile.

What is the difference between at-home and in-office tooth whitening treatments?

Plasma Arc Light whitening is one method of in-office dental whitening. It uses an advanced Xenon bulb and liquid light guide technology together with a hydrogen peroxide whitening gel. The patented Whitening Arch distributes light evenly over the entire anterior area of the patient's mouth, increasing effectiveness while decreasing the total procedure time. The whole procedure can be completed in just one hour, and one office visit. At-home whitening requires a special tray and several weeks of continual whitening material application for complete results.

Who can benefit from Everbrite™?

Anyone with healthy teeth can use Everbrite™. Those with staining due to tetracycline, dental fluorosis, etc., may require additional use for maximum effectiveness.

Is Everbrite™ safe? Will it cause damage to the tooth structure?

Everbrite™ uses a form of whitening gel that, when exposed to a specific wavelength of visible light, breaks down into free oxygen ions which work on the enamel and dentin of the teeth and neutralize the discolorations. It is proven to be safe and effective.

How long after using Everbrite™ will teeth remain white?

When properly using Everbrite™ as well as avoiding strongly staining foods and drinks, the results of the teeth whitening can be maintained for a period of about 1-2 years.

Why is there mild tooth sensitivity after the procedure?

This is normal and recovery should be relatively quick. About 10-15% of users will experience some sensitivity. If sensitivity occurs, fluoride treatment can be applied to reduce sensitivity.

Can Everbrite™ be used when cavities or gum bleeding are present?

Your dentist must treat cavities, gum bleeding, or any other dental issues before beginning the Everbrite™ procedure.

Everbrite Your Smile

**THE BRIGHT AND CONFIDENT SMILE
OF YOUR DREAMS CAN BE
MAKE A REALITY.**

The staining agents from food, drinks, and some drugs will slowly enter and stain the enamel of our teeth.

Everbrite™ is a specially formulated whitening material designed to oxidize the stains and whiten your teeth.

Safe, Fast, and Effective

- The doctor will check your teeth and gums before treatment to make sure there is no periodontal disease or other dental issues.
- The doctor will use a shade guide to record the shade before the treatment and show you the difference before and after the whitening procedure.
- The doctor will apply lip retractor, cotton roll, mouth bib, and liquid dam to protect your soft tissue and gums.
- The doctor will then apply the Everbrite™ tooth whitening material and begin the plasma whitening light program for a total of 4 whitening cycles.
- The doctor will then clean your mouth and do a before and after comparison.

NOTE :

- Minor sensitivity is normal and should disappear in about 2 days. If necessary, rinse with Flocare 0.4% stannous fluoride to relieve any sensitivity.
- If any area of oral soft tissue comes into contact with the whitening gel and becomes discolored, it will return to normal in about 2 days.
- Avoid stain causing food and drinks for about a week after treatment.
- The At-Home Everbrite™ Kit is recommended to maintain and prolong optimal whitening results.

WARNING :

- Patients should not undergo the whitening procedure if they have recently had oral surgery, have cavities, periodontal disease or other dental issues.
- Everbrite™ is not recommended for children or pregnant woman.
